Supports [34 Regions](#)

No local KV/data support but you can use external services or *read* cached files on the [file system](#) (there's no support for writing to the file system from an edge function however). Support for the cache API is on the [roadmap](#)

Support [JSX (and TSX)](#) out of the box which can be useful for SSR using the `renderSSR` function ([source](#))

> Deno Deploy supports outbound TCP and TLS connections. These APIs allow you to use databases like PostgreSQL, SQLite, MongoDB, etc., with Deploy.
> [Source](#)

A decent number of npm modules have been ported to Deno. You can use ones that aren't ported provided they use ES Modules format, as Deno does not support CommonJS. This means a lot of existing modules may not work.
